CASE REPORT

Case Details

Reference ID	CTHTY-237
Title	User downloaded uTorrent_installer.exe
Status	Closed
Severity	Low
Tactics	Initial Access
Created By	christopher.mirro@thevsoc.com
Created At	Jul 29, 2026, 08:17 PM
Category	Access Protection
Sub-Category	Access to Inappropriate Content
Tenant	Cythority
Age	4 minutes
Offense ID	—

Analysis Summary

On 7/29/2026 at 7:20 , Cythrority's VSOC investigated a Malicious detection on SentinelOne. The user downloaded utorrent_installer(1).exe from the Google chrome browser. uTorrent is a popular BitTorrent software application used for peer-to-peer file sharing over the internet. While uTorrent itself is a legitimate application, SentinelOne has flagged its installer as a PUA/P (potentially unwanted application/program.) Free versions of uTorrent have historically come bundled with third-party adware, toolbars, and other potentially unwanted background software. The BitTorrent protocol is also heavily used to share pirated software, games, and media, which often contains hidden trojans or executable malware. Essentially opening the floodgates with a torrent application downloading peer-to-peer files, malicious actors can achieve things such as initial access, execution, defensive evasion, persistence, and command and control privileges.

Upon further investigation, Even though SentinelOne’s AI engine marked the confidence level as MALICIOUS, vendor detections for standard uTorrent installers fall under Potentially Unwanted Applications (PUA/PUP), which is considered low. The file is currently sitting in the user's \Downloads folder (utorrent_installer (1).exe). It is an unexecuted installer, meaning no system files have been modified, no unauthorized network connections have been established by the application, and no secondary malware payload has been executed. The process originated from chrome.exe via a web download; it was not dropped by an active exploit or living-off-the-land (LotL) binary attack. The console shows the publisher is BITTORRENT INC with a SignedVerified status. This confirms it is the standard, signed uTorrent package rather than a trojanized/masquerading executable. It affects a single workstation (DESKTOP-KCTG4JP) and has not spread across the network.

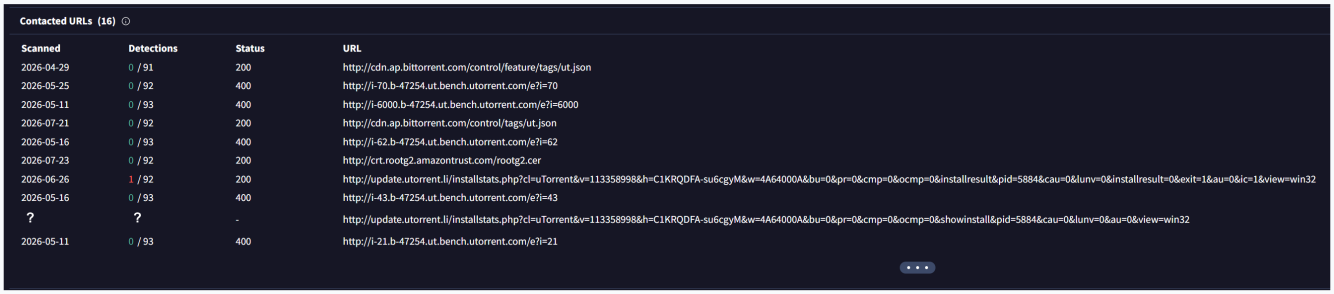

While it is in fact a True Positive, being a PUA/P violation, it is not considered a malicious alert. No secondary payload analysis shows actual harmful code embedded in the installer.

The hash associated with the file- 766af0010e673168c3c391a5274161643dfb08af was enriched using multiple sources. While VirusTotal shows 21/69 security engines flagging the file as malicious, often grouping it under broad labels like "trojan", a closer look at the vendor signatures (like OfferCore, PUABundler, and PUP.Optional) confirms this is a Potentially Unwanted Application (PUP) rather than standard malware. The same applies to TalosIntelligence. The detection is triggered by aggressive third-party adware bundled into the uTorrent installer rather than a targeted virus, ransomware, or credential stealer; therefore, while the alert is a True Positive for unauthorized software and a clear corporate policy violation, its operational risk remains low as long as the installer is quarantined before execution.

Remediation

- Quarantine the File
- Kill Active Processes (If Running)
- Inspect the Endpoint
- User Outreach & Counseling
- Switch Policy from Detect to Protect
- Enforce Web Filtering / URL Blocking
- Implement Application Control / AppLocker
- Enforce Least Privilege
- Security Awareness Training
